## 1 Overview

IRMCK143 is a new generation International Rectifier integrated circuit device primarily designed as a one-chip solution for complete inverter controlled appliance motor control applications. Unlike a traditional microcontroller or DSP, the IRMCK143 provides a built-in closed loop sensorless control algorithm using the unique Flexible Motion Control Engine (MCE™) for permanent magnet motors as well as induction motors. The MCE™ consists of a collection of control elements, motion peripherals, a dedicated motion control sequencer and dual port RAM to map internal signal nodes. IRMCK143 also employs a unique single shunt current reconstruction circuit to eliminate additional analog/digital circuitry and enables a direct shunt resistor interface to the IC. Motion control programming is achieved using a dedicated graphical compiler integrated into the MATLAB/Simulink™ development environment. Sequencing, user interface, host communication, and upper layer control tasks can be implemented in the 8051 high-speed 8-bit microcontroller. The 8051 microcontroller is equipped with a JTAG port to facilitate emulation and debugging tools. Figure 1 shows a typical application schematic using the IRMCK143.

IRMCK143 contains 32K bytes of OTP program ROM, The IRMCF143 contains 64K bytes of Flash and intended for development purposes only while the IRMCK143 is intended for volume production. Both the development and ROM versions come in a 64-pin QFP package with identical pin configuration to facilitate PC board layout and transition to mass production.
